

Data tidying

In this project I processed the data from 'billboard.csv' dataset:

- I removed the columns containing number of week when the song appeared on the Billboard List and created rows from it, replacing them by new columns: week and rank
- Using informations from columns date.entered and date.peaked I created new column date and removed previous ones
- Then gave an unique id to every song on the list
- Then data was prepared to create two separate lists, which were ready to analyze them
